

Creating effective figures for conference presentations and publications

Gaurav Kandlikar

Ecology and Evolutionary Biology
Graduate Writing Center Consultant

Trading places, Mexico and Greenland swap in the Mercator projection

@neilrkaye

Why do we make figures?

Why do we make figures?

How do we consume (read) figures?

Graphs and charts let you explore and learn about the structure of the information you collect.

Good data visualizations also make it easier to communicate your ideas and findings to other people.

“[Data Visualization](#)” , Kieran Healey, 2018

Graphs and charts let you explore and learn about the structure of the information you collect.

Good data visualizations also make it easier to communicate your ideas and findings to other people.

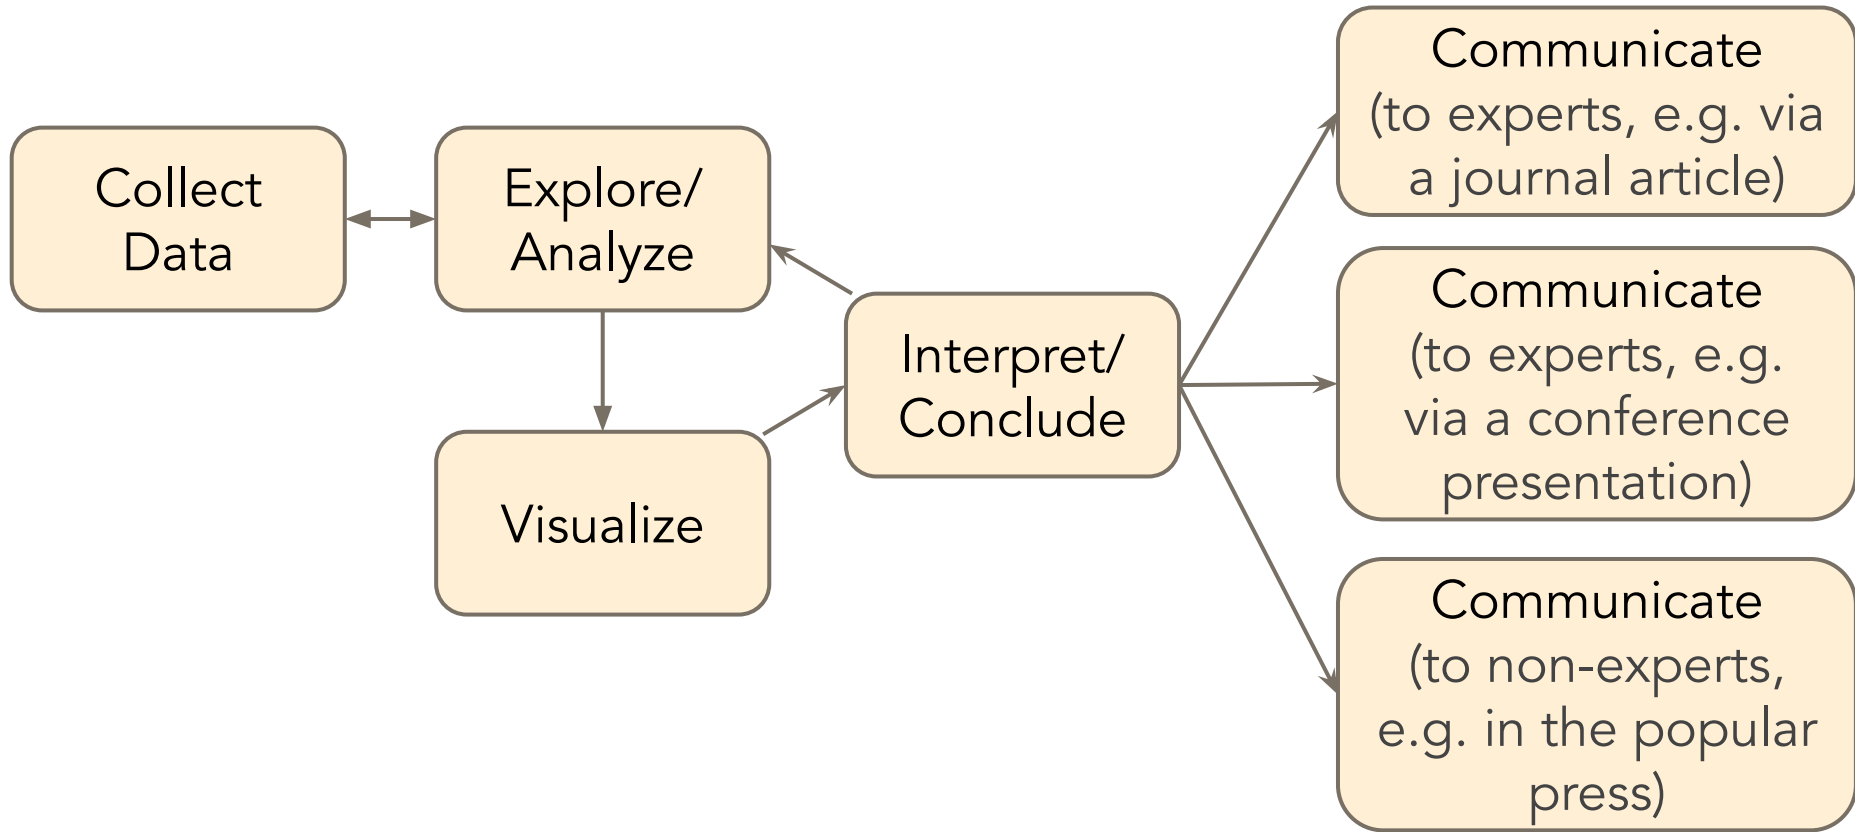

["Data Visualization"](#) , Kieran Healey, 2018

Data visualization is part art and part science. The challenge is to get the art right without getting the science wrong and vice versa.

A data visualization first and foremost has to accurately convey the data. It must not mislead or distort.

If one number is twice as large as another, but in the visualization they look to be about the same, then the visualization is wrong.

["Fundamentals of Data Visualization"](#) , Claus Wilke 2018

Outline of the workshop

1. “Theoretical” considerations

- Types of figures

- Mapping data onto figures

- Encouraging accurate comparisons

2. “Practical” considerations

- Color choice

- Adapting figures for the audience

- File formats

Types of figures

Elements of a good figure

A good figure is one that...

1. Shows the data
2. Tells the truth
3. Helps the viewer think about the information
4. Encourages viewers to make comparisons
5. Makes large data sets coherent
6. Maximizes data-to-ink ratio (within reason)

The Visual Display of Quantitative Information, Edward Tufte

What makes a figure bad?

Figures are often bad because of one of these three problems:

1. They commit aesthetic faux pas
(e.g. ugly color combinations or fonts)
2. They don't play well with human perception
(e.g. too many categories colored in a plot)
3. There are substantive problems with the data
(e.g. wrong variable shown)

Scientific figures are a blend of two disciplines: information design and graphic design

- [Kelly Krause](#), Creative Director at Nature

Scientific figures are a blend of two disciplines: information design and graphic design

- [Kelly Krause](#), Creative Director at Nature

Scientific figures are a blend of ~~two~~ **three** disciplines: information design and graphic design, **and the scientific domain**

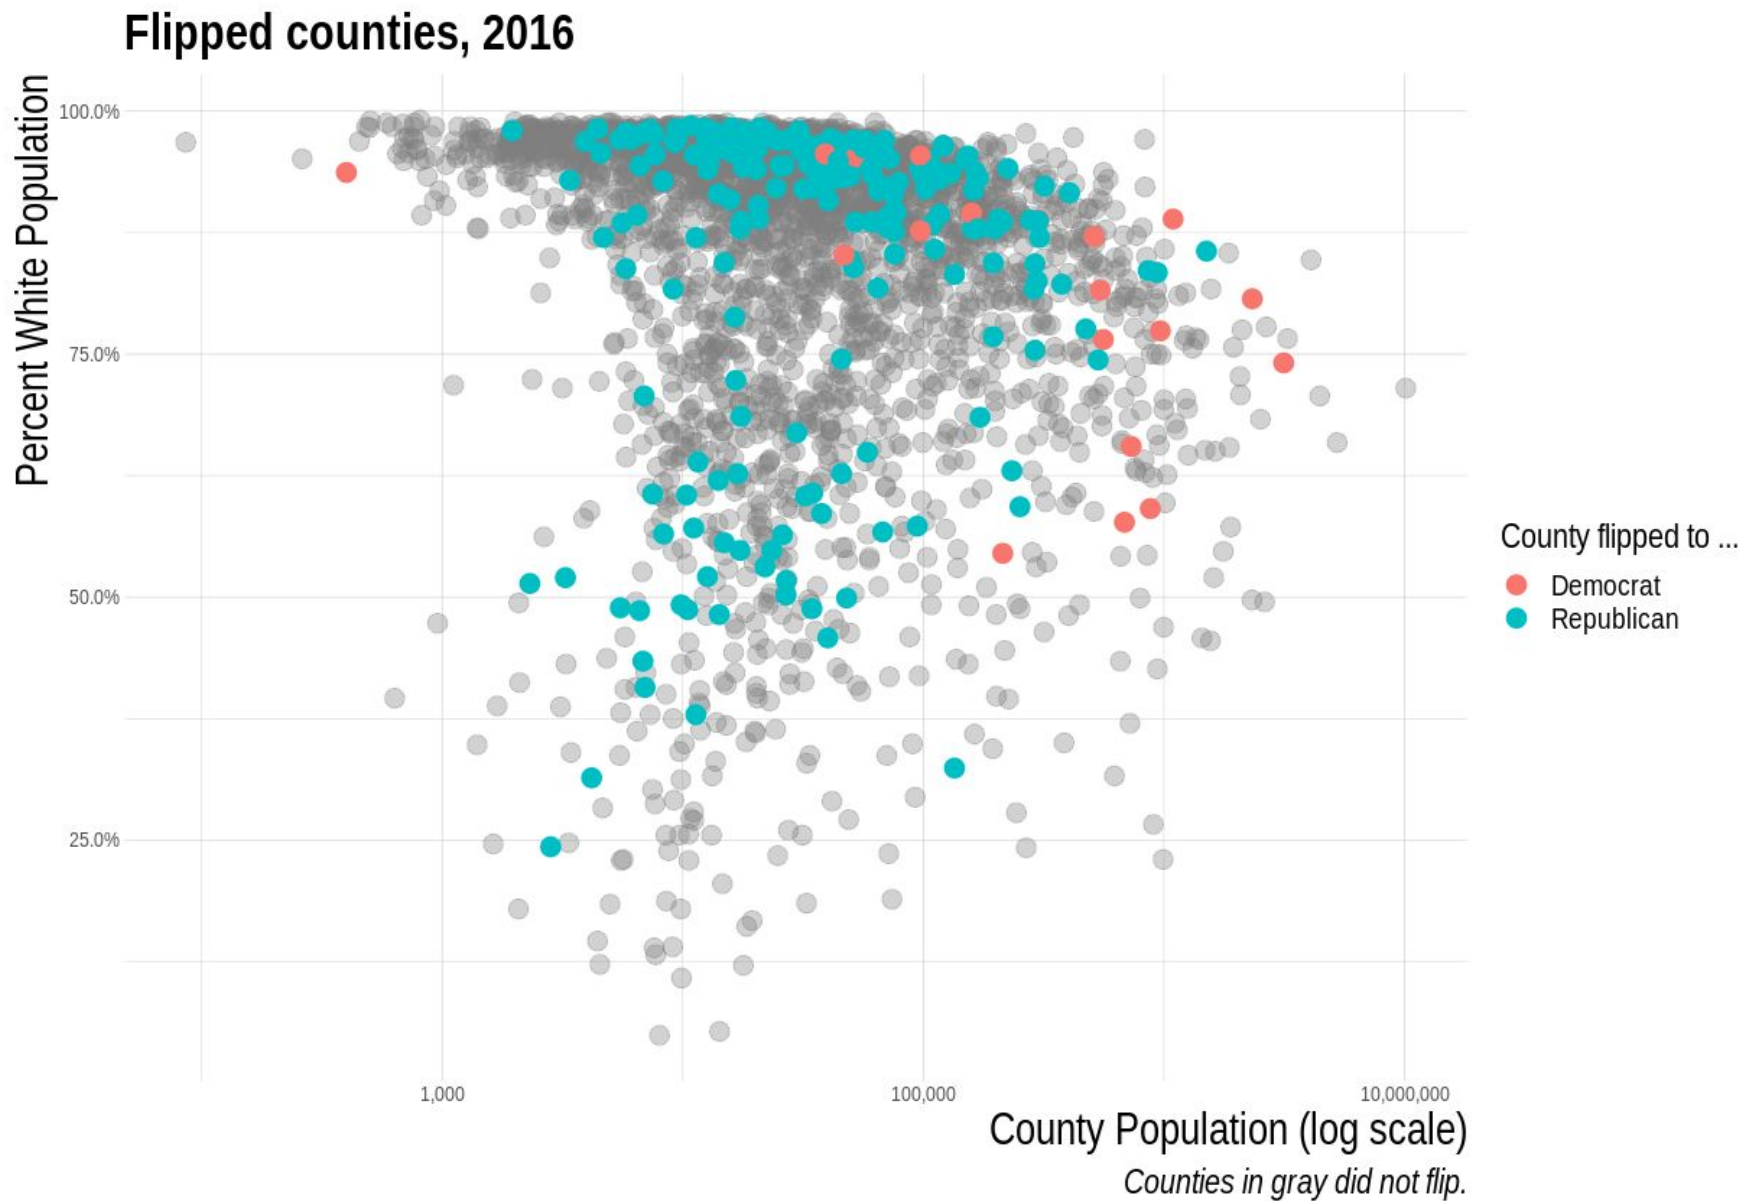

Transforming a figure: An example from 2016 US elections

Example from "[Data Visualization](#)", Kieran Healey, 2018

Eliminated grey background

Increased font and point sizes; added informative axis labels

Flipped counties, 2016

County flipped to ... ● Democrat ● Republican

Moved legend to the top to make better use of space

Flipped counties, 2016

County flipped to ... ● Democrat ● Republican

Changed color palette to align with viewer perceptions

Mapping data onto figures

The figure on the previous slide has three “dimensions” of information:

- x position;
- y position;
- color.

Mapping data onto figures

The figure on the previous slide has three “dimensions” of information:

- x position;
- y position;
- color.

If appropriate, we can map extra dimensions of data onto different channels single figure.

Flipped counties, 2016

Party flipped to ...

● Democrat ● Republican

Median household income

● \$25,000 ● \$50,000 ● \$75,000 ● \$100,000

Sized points by household income

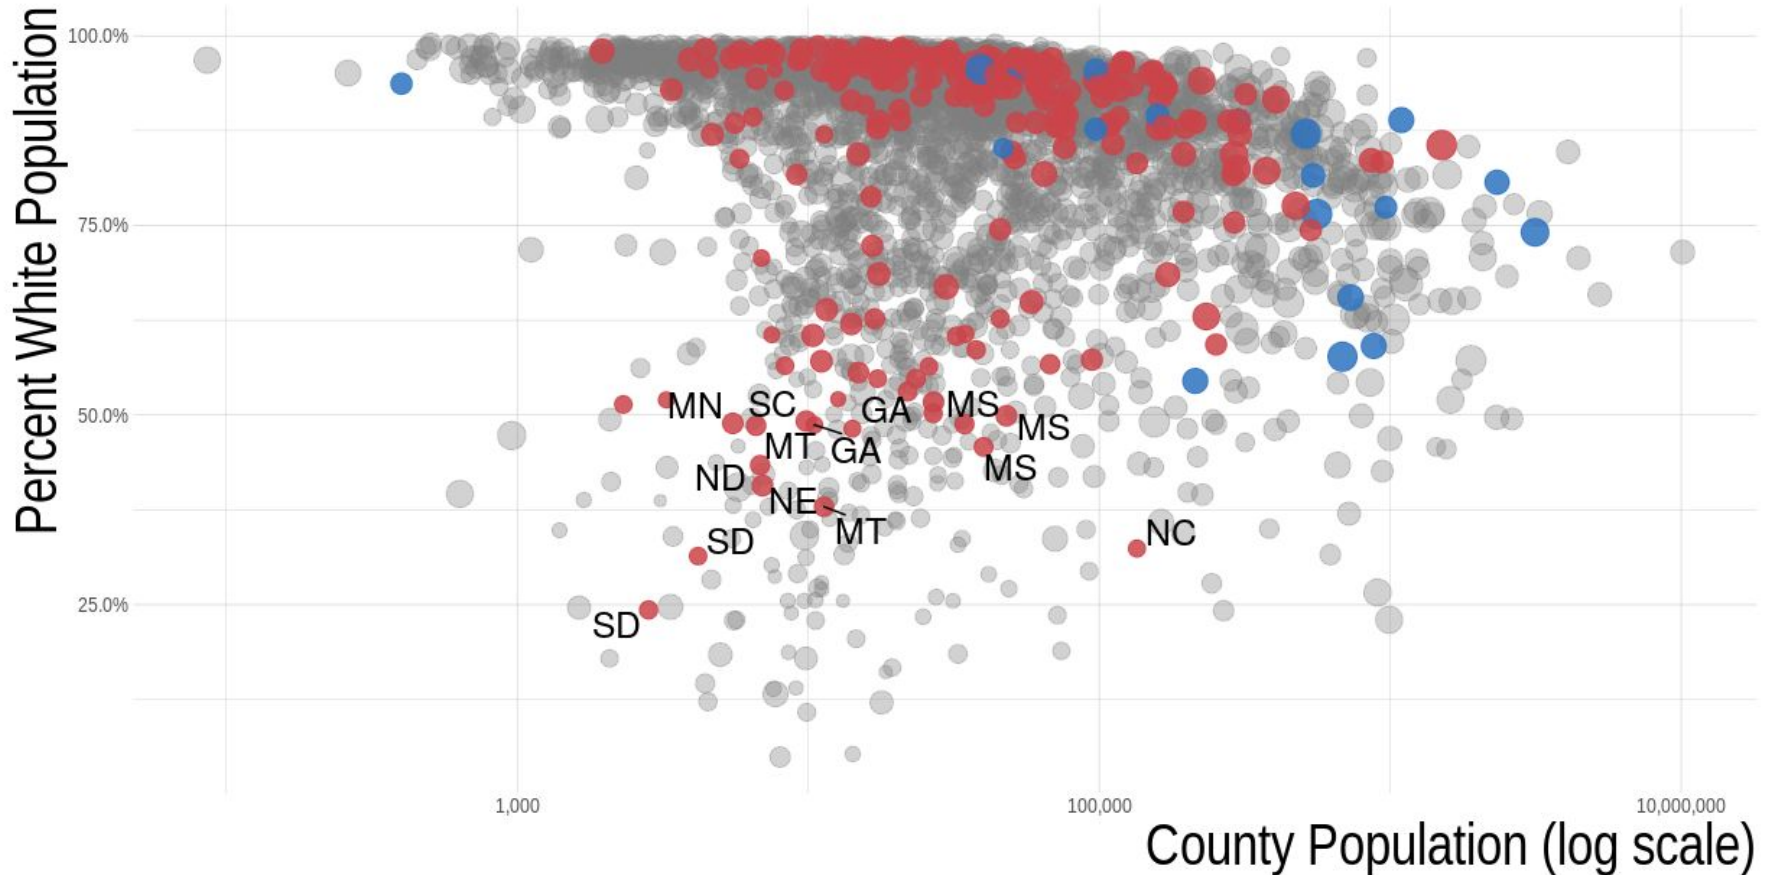

Flipped counties, 2016

Party flipped to ...

● Democrat ● Republican

Median household income

● \$25,000 ● \$50,000 ● \$75,000 ● \$100,000

*Counties in gray did not flip.
States of counties with <50% White population that flipped are labeled*

Labeled outlier points (and explained the labeling with text)

Figures are not data dumps.

They should help viewers make sense of information.

This means that in some cases, not all data points will be treated in the same way.

Flipped counties, 2016

Counties in gray did not flip.
States of counties with <50% White population that flipped are labeled

Note that not all points are labelled- that's OK!

Elements of a good figure

A good figure is one that...

1. Shows the data
2. Tells the truth
3. Helps the viewer think about the information
4. Encourages viewers to make comparisons
5. Makes large data sets coherent
6. Maximizes data-to-ink ratio (within reason)

The Visual Display of Quantitative Information, Edward Tufte

What makes a figure bad?

Figures are often bad because of one of these three problems:

1. They commit aesthetic faux pas
(e.g. ugly color combinations or fonts)
2. They don't play well with human perception
(e.g. too many categories colored in a plot)
3. There are substantive problems with the data
(e.g. wrong variable shown)

Multipanel figures

The same principles of good and bad figures apply to multipanel figures.

Some notes:

- Use consistent color schemes
- Follow reader expectations
(e.g. organize information left to right, top to bottom)
- Clarify how the different elements relate to each other

Pay special attention to figure legends and axis labels.

A good figure (+ legend) should stand on its own.

Consider thinking about a figure legend as a mini-abstract for the figure.

- 1) Main takeaway;
- 2) Very brief methods overview;
- 3) Source of data.

Outline of the workshop

1. “Theoretical” considerations

- Types of figures

- Mapping data onto figures

- Encouraging accurate comparisons

2. “Practical” considerations

- Color choice

- Adapting figures for the audience

- File formats

Color choice

Color choice 1: Design for colorblind viewers

*Color blindness simulated using [Coblis](#);
More advice on [designing for accessibility](#).*

Color choice 1: Design for colorblind viewers

Color blindness

Color blindness simulated using [Coblis](#);
More advice on [designing for accessibility](#).

Color choice 2: Context changes color perception

Color choice 2: Context changes color perception

Color choice 3: Appropriate palettes

Decide whether *qualitative*, *sequential*, or *divergent* palettes are right for your figure.

Coloring by category;
order is arbitrary

Highlight high (or low)
values of a quantitative
variable

Highlight high and low
values of a quantitative
variable

Some suggestions for choosing colors

1. Design colorblind-friendly figures
use [colorblind-friendly palettes](#) to design your figures and [verify on colorblindness simulators](#).
2. Use “natural” choices
e.g. blue for Dems/red for Reps in the US;
blue → red for cold → hot;
map color onto natural differences between groups (e.g. between different species).
3. Use sequential/diverging/qualitative palettes as appropriate -- see [colorbrewer](#) palettes
4. Consider the context.

Key reminder for working with colors

Try not to rely on color to encode any essential information.

(It should only enhance information that is available without color.)

Flipped counties, 2016

Party flipped to ...

● Democrat ● Republican

Median household income

● \$25,000 ● \$50,000 ● \$75,000 ● \$100,000

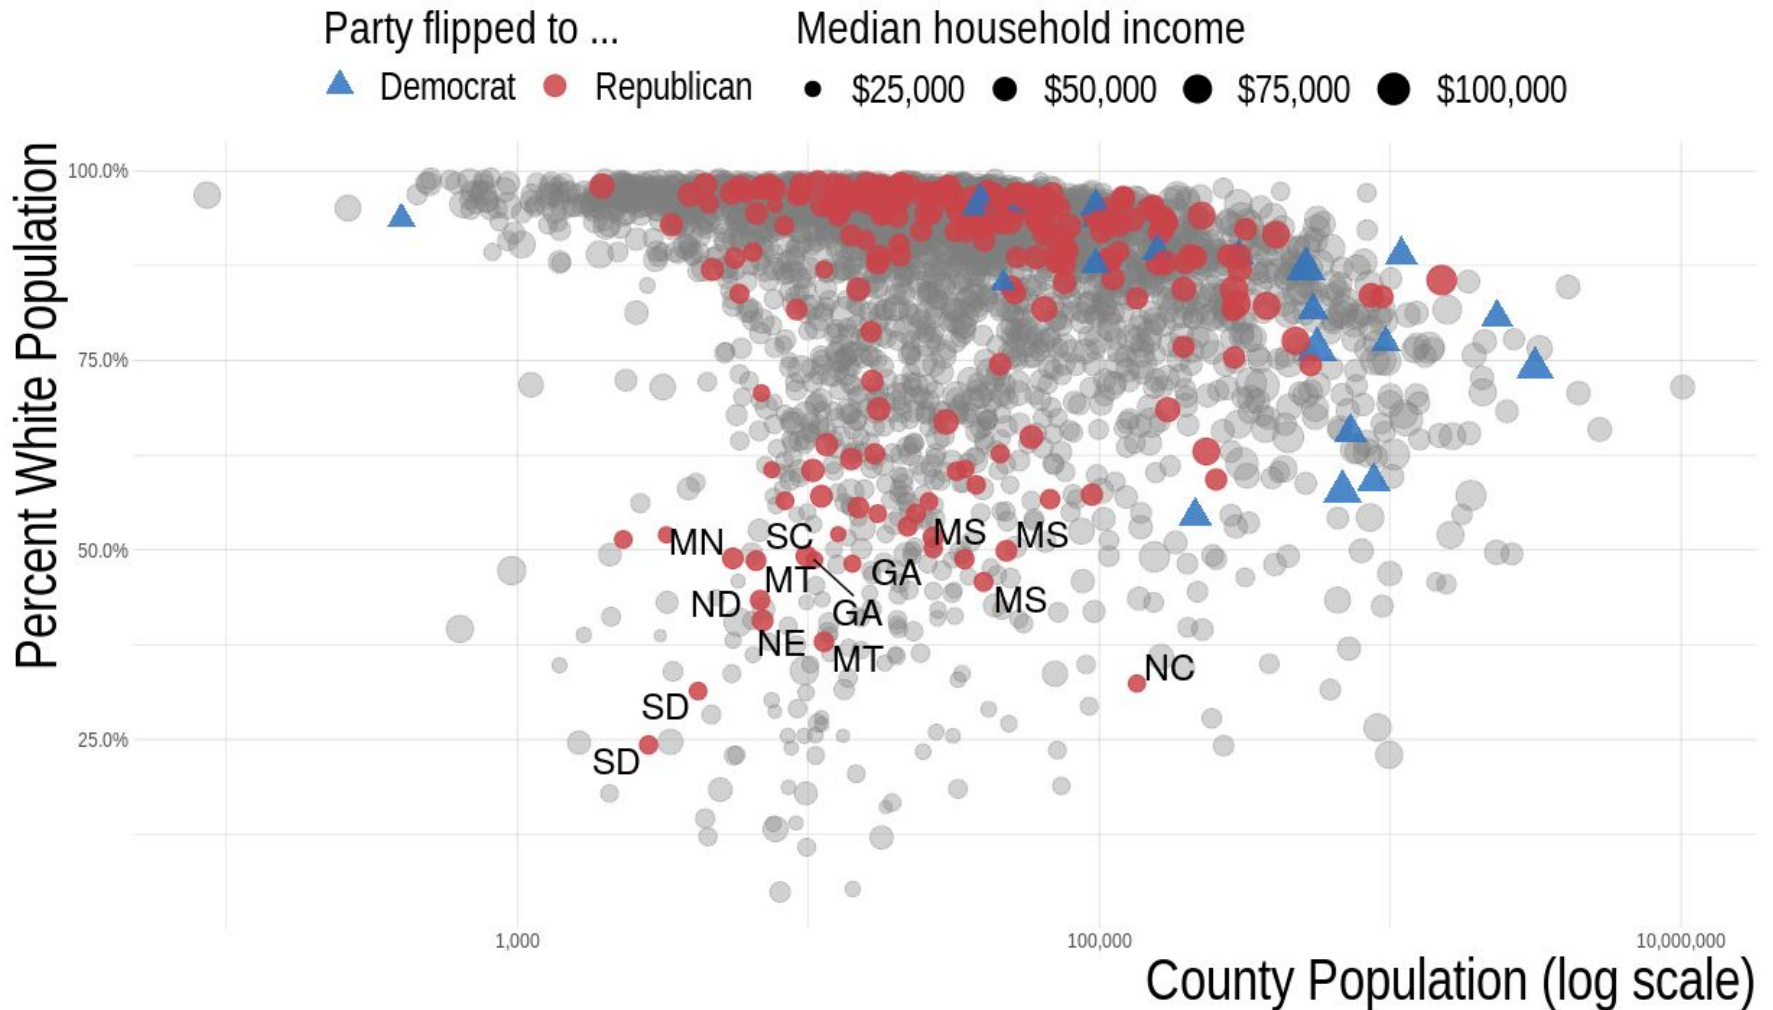

County Population (log scale)

Counties in gray did not flip.

States of counties with <50% White population that flipped are labeled

Flipped counties, 2016

Converted blue circles into blue triangles

Adapting figures for the audience

Adapting figures for the audience

For a paper

How does this figure render in black and white?

How does the figure scale down to a smaller size?

Does the information in this figure interact well with manuscript text?

Adapting figures for the audience

For a paper

How does this figure render in black and white?

How does the figure scale down to a smaller size?

Does the information in this figure interact well with manuscript text?

For a presentation

Is the figure clearly visible for the audience?

Does the information in this figure interact well with the slides around it?

Will the audience have enough time to digest the information?

File formats

File formats

“Raster” formats:

Based on coloring
particular pixels at
particular locations.

Each file is optimized
at a particular
resolution -- so, scaling
up results in blurry
images.

e.g. JPEG, PNG

File formats

“Raster” formats:

Based on coloring particular pixels at particular locations.

Each file is optimized at a particular resolution -- so, scaling up results in blurry images.

e.g. JPEG, PNG

“Vector” formats:

Based on connecting points in a 2-D plane with lines and curves.

These files are scalable to any size, the figures are “crisper”, and the file sizes are small

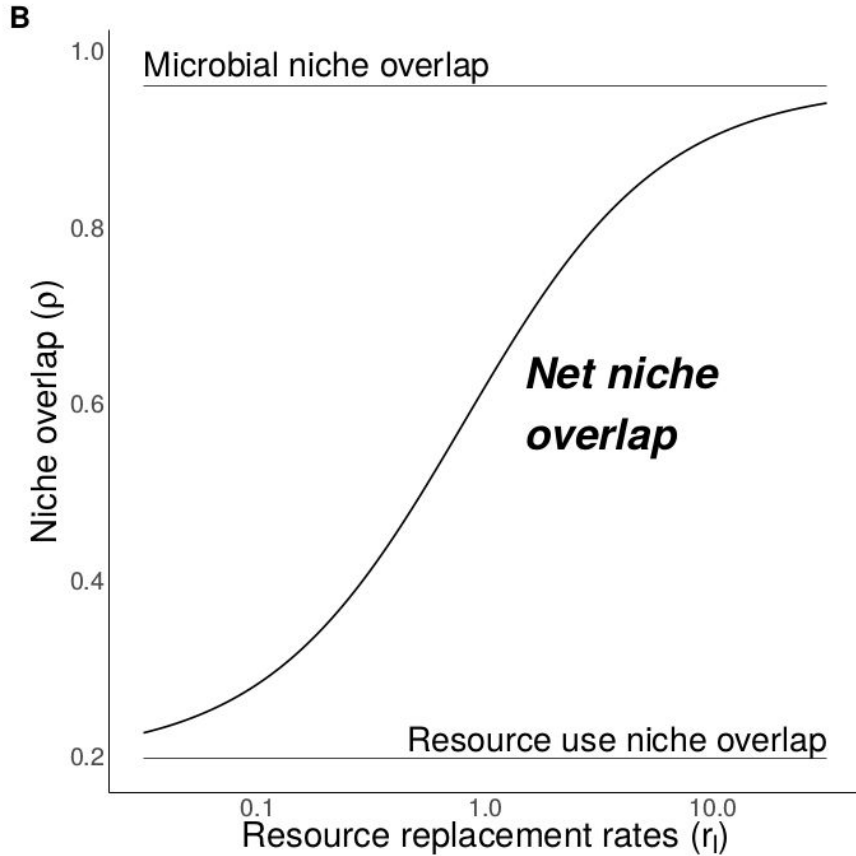

e.g. SVG, PDF

(Free) tools for working with figures

For any figure that involves data, do it all in your favorite scripting language (e.g. Python, R).

1. Fully reproducible, easy to recreate.
2. Documents all data manipulations explicitly.
3. Easy to convert between file formats and resolutions

2. Documents all data manipulations explicitly.
3. Easy to convert between file formats and resolutions

Free graphics software:

Gimp (for rasterized images, e.g. PNGs, JPGs)

Inkscape (for vectorized images, e.g. SVGs)

Figures as an integral part of the writing process

Treat figures the same way as all other aspects of your writing: Make drafts, get comments, revise.

When creating a figure, think about how it will be consumed by the reader.

“Read” figures widely for inspiration.

[R Graph Gallery](#); [Edward Tufte's books](#); look through 'high-profile' figures in your field (but don't take them as gospel)

Elements of a good figure

A good figure is one that...

1. Shows the data
2. Tells the truth
3. Helps the viewer think about the information
4. Encourages viewers to make comparisons
5. Makes large data sets coherent
6. Maximizes data-to-ink ratio (within reason)

Carte Figurative des pertes successives en hommes de l'Armée Française dans la campagne de Russie 1812-1813.

Dressée par M. Minard, Inspecteur Général des Ponts et Chaussées en retraite. Paris, le 20 Novembre 1869.

Poland

hommes présents sont représentés par les largeurs des zones colorées à raison d'un millimètre pour dix mille hommes; ils sont de plus écrits en travers de la carte. Les renseignements qui ont servi à dresser la carte ont été puisés de M. M. Thiers, de Ségur, de Fezensac, de Chambray et le journal inédit de Jacob, pharmacien de l'Armée depuis le 28 Octobre.

Une seule chose j'ai jugé à l'œil la diminution de l'armée, j'ai supposé que les corps du Prince Jérôme et du Maréchal Davoust qui avaient été détachés sur Minsk et Mohilow et ont rejoint vers Orscha et Witebsk, avaient toujours marché avec l'armée.

Moscow

TABLEAU GRAPHIQUE de la température en degrés du thermomètre de Réaumur au dessous de zéro.

Les Cosaques passent au galop le Niémen gelé.
